2. BAGGRUND

Risikoen for at opleve et seksuelt overgreb opstår tidligt i livet. Danske og internationale studier peger på, at op imod hver femte unge pige eller kvinde har oplevet et seksuelt overgreb fra en jævnaldrende (Black et al., 2011; Bramsen, 2012).

Hertil kommer overgrebets ofte massive sociale, personlige og økonomiske omkostninger, som kaster mørke skygger længe efter den krænkende episode (Bramsen, 2012). Vi ved, at første overgreb er en markant risikofaktor for gentagne episoder af overgreb (Humphrey & White, 2000), hvorfor tidlig opsporing og forebyggende interventioner potentielt kan forhindre en uhensigtsmæssig voldsspiral (Bramsen, 2012).

På trods af den markante forekomst findes der aktuelt kun et begrænset antal primære forebyggende indsatser specifikt målrettet danske unge (Bramsen, 2012). De eksisterende indsatser er typisk karakteriseret ved fragmenterede tiltag, der for hovedparten bygger på praksiserfaring og ikke evidensbaseret viden. Disse forhold er forståelige, men samtidig årsag til bekymring. Yderligere er indsatserne ikke systematisk evalueret, og det er således uklart, om de eksisterende indsatser reelt formår at reducere forekomsten af seksuelle overgreb blandt danske unge (Bramsen, 2012).

Vender vi blikket mod udlandet, har man særligt i USA været optaget af at anerkende seksuelle overgreb som et folkesundhedsproblem (Dahlberg & Mercy, 2009). Folkesundhedstilgangen har fokus på den primære forebyggelse, det vil sige forebyggelse af overgrebet *inden* det finder sted.

Aktuelt findes to systematiske litteraturstudier specifikt omhandlende primær forebyggelse af seksuelle overgreb blandt unge og/eller voksne (Anderson & Whiston, 2005; Morrison et al., 2004). Begge studier konkluderer, at effekten af undersøgte undervisningsprogrammer er usikker grundet metodiske problemstillinger.

Der er indtil videre ikke gjort nogen forsøg på at samle den publicerede viden på ungeområdet. Således eksisterer der ingen systematisk kortlægning af forebyggende programmer eller metoder specifikt målrettet seksuelle overgreb blandt unge mennesker i aldersgruppen 12-18 år (Cook-Craig, 2012). Til udvikling og implementering af nye interventioner er det imidlertid centralt at indsatser udspringer af den allerede eksisterende videns- og erfaringsbase, men tilpasses eller justeres i forhold til den pågældende kulturelle kontekst.

Formålet med nærværende forskningsoversigt er derfor at indsamle og kortlægge international viden og erfaringer omkring interventioner til forebyggelse af seksuelle overgreb blandt unge. Resultater herfra skal benyttes til at styrke det faglige felt på området, herunder Det Kriminalpræventive Råds (DKR) videre rådgivning.

3. METODE

Nærværende forskningsoversigt er baseret på opdrag fra TrygFonden og DKR. Oversigten er udarbejdet i regi af Forskningsgruppen Udsatte Børn og Unge, ved Institut for Psykologi, Syddansk Universitet. Med hjælp fra studentermedhjælp Tobias Kaldahl og Anne Katrine Hartmann. Udarbejdelse af oversigten er pågået i perioden fra d. 1.1.2013 – 15.5.2013.

3.1. KRITERIER

Følgende kriterier var bestemmende for, hvilke studier der blev ekskluderet i screeningsprocessen henholdsvis indgik i den endelige forskningsoversigt. Videre fungerede kriterierne som rettesnor til at informere oversigtens søgemetoder, herunder udformning af søgestreng samt valg af benyttede søgedatabaser. Kriterierne er hovedsageligt formuleret af DKR:

<i>Studiet</i>	Studiet er publiceret imellem år 2000-2013
	Studiet er internationalt (udgivet på engelsk, tysk eller skandinavisk)
	Studiet har som formål at undersøge effekten af en intervention rettet imod forebyggelse af seksuelle overgreb
	Studiet omhandler seksuelle overgreb blandt unge
<i>Deltagere</i>	Deltagere med en gennemsnitsalder imellem 12-18 år
<i>Interventioner</i>	Interventionen er målrettet den almene ungegruppe eller ungegruppen i særlig risiko (ikke en klinisk population)
<i>Effekt</i>	Studiet er gennemført med et forskningsdesign, der kan indikere effekt (enten ved brug af pre/post-test måling eller ved brug af kontrolgruppe)
	Studiet undersøger effekten af en intervention på baggrund af primære effektmål (reduceret udøvelse af/udsættelse for seksuelle overgreb) eller sekundære effektmål (holdninger, viden og adfærd mv.)

I nærværende forskningsoversigt er definitionen af seksuelt overgreb formuleret ved DKR og dækker over: *"en række forskellige former for seksuelle overgreb fra at blive seksuelt krænket, få lagt intime billeder på nettet eller at blive tvunget til sex med eller uden brug af vold, og omfatter således alt fra seksuel chikane til forsøg på og gennemført voldtægt"* (Udbudsskrivelse ved DKR, 2012).

3.2. SØGEMETODER

Litteratursøgningsprocessen blev gennemført og dokumenteret på systematisk vis. Indledningsvist udarbejdedes en søgestreng, som havde til formål dels at indfange samtlige tilgængelige studier, dels at indsnævre søgningerne, så de afspejlede kriterierne til oversigten.

Søgestrengen var således opdelt i forskellige kategorier, der talte **overgreb** (rape OR sex* assault* OR sex* victim* OR sex* abuse* OR sex* violen* OR sex* offen* OR sex* predat* OR sex* perperat*), **forebyggelse** (prevent* OR intervent* OR program* OR educat* OR reduc*), **effektmåling** (evaluat* OR assess* OR effect* OR measure* OR review* OR meta analy* OR evidenc* OR outcome*), **unge** (adolesc* OR young* OR youth* OR pupil* OR boy* OR girl* OR teen* OR middle school* OR high school* OR student*), samt **publiceringsperiode** (PY=2000 – present).

Den endelige søgestreng, som blev benyttet på tværs af databasesøgningerne, var som følger:

```
rape OR sex* assault* OR sex* victim* OR sex* abuse* OR sex* violen* OR sex* offen*
OR sex* predat* OR sex* perperat* AND prevent* OR intervent* OR program* OR
educat* OR reduc* AND evaluat* OR assess* OR effect* OR measure* OR review* OR
meta analy* OR evidenc* OR outcome*AND adolesc* OR young* OR youth* OR pupil*
OR boy* OR girl* OR teen* OR middle school* OR high school* OR student*AND
PY=2000 – present
```

Følgende internationale databaser blev afsøgt i tidsperioden januar - februar 2013. Databaserne blev udvalgt således, at de dækkede mange fagområder (fx sygepleje, psykologi, medicin, sociologi mv.), indhentede studier fra mange forskellige tidsskrifter, samt var i stand til at identificere Ph.d.-afhandlinger:

- Applied Social Science Index and Abstracts
- Cinahl
- Cochrane
- Embase
- ERIC
- PsychINFO
- PubMed
- Sociological Abstracts

Søgningerne blev lavet i *abstracts (ab)*, *title (ti)*, *keywords (kw)* og/eller *all fields*, i de tilfælde, det ikke var muligt at opdele søgningsfelterne.

Derudover inkluderedes litteratur, som forfatterne var bekendt med i forvejen, men som faldt udenfor ovenstående litteratursøgningsproces. Endelig blev forskningsoversigtens udformning diskuteret med Regents Professor Mary P. Koss, University of Arizona i forbindelse med studiebesøg (januar, 2013). Dr. Koss bidrog til processen med sparring og forslag til relevante interventionstudier og nøgleaktører på feltet.

3.3. SCREENING

Ovenstående databasesøgninger resulterede i 7918 hits. Screeningsprocessen fulgte derefter tre trin:

1. Gennemgang af abstracts. Tre personer vurderede indledningsvist 3 x 50 abstracts med baggrund i inklusions- og eksklusionskriterier. Efter hver vurdering diskuterede forskningsgruppen eventuelle uoverensstemmelser. Ved tredje vurdering havde de tre personer en tilfredsstillende interrater-pålidelighed (Kappa = .80), hvorefter de 7918 hits blev vurderet for eventuel inklusion.
2. Første gennemlæsning. På baggrund af trin 1 blev den inkluderede litteratur indhentet og gennemlæst. Oversigtsartikler- og kapitler blev ekskluderet og noteret til videre gennemsyn. Den øvrige litteratur blev vurderet, og eksklusionskriterier dokumenteret med udgangspunkt i følgende eksklusionsliste. Usikkerheder blev diskuteret i forskningsgruppen.

1	Publicerings år
2	Udgivelse (sprog)
3	Udgivelse (tidsskrift, bog, rapport eller afhandling)
4	Deltagernes alder
5	Primære fokus på forebyggelse
6	Rapporteret effekt af intervention

3. Anden gennemlæsning. På baggrund af trin 2 blev den inkluderede litteratur gennemgået af tre personer for endelig inklusion i forskningsoversigten. Alle uoverensstemmelser blev diskuteret med henvisning til de oprindelige kriterier. Eksklusionskriterier blev dokumenteret på samme vis som ved første gennemlæsning.

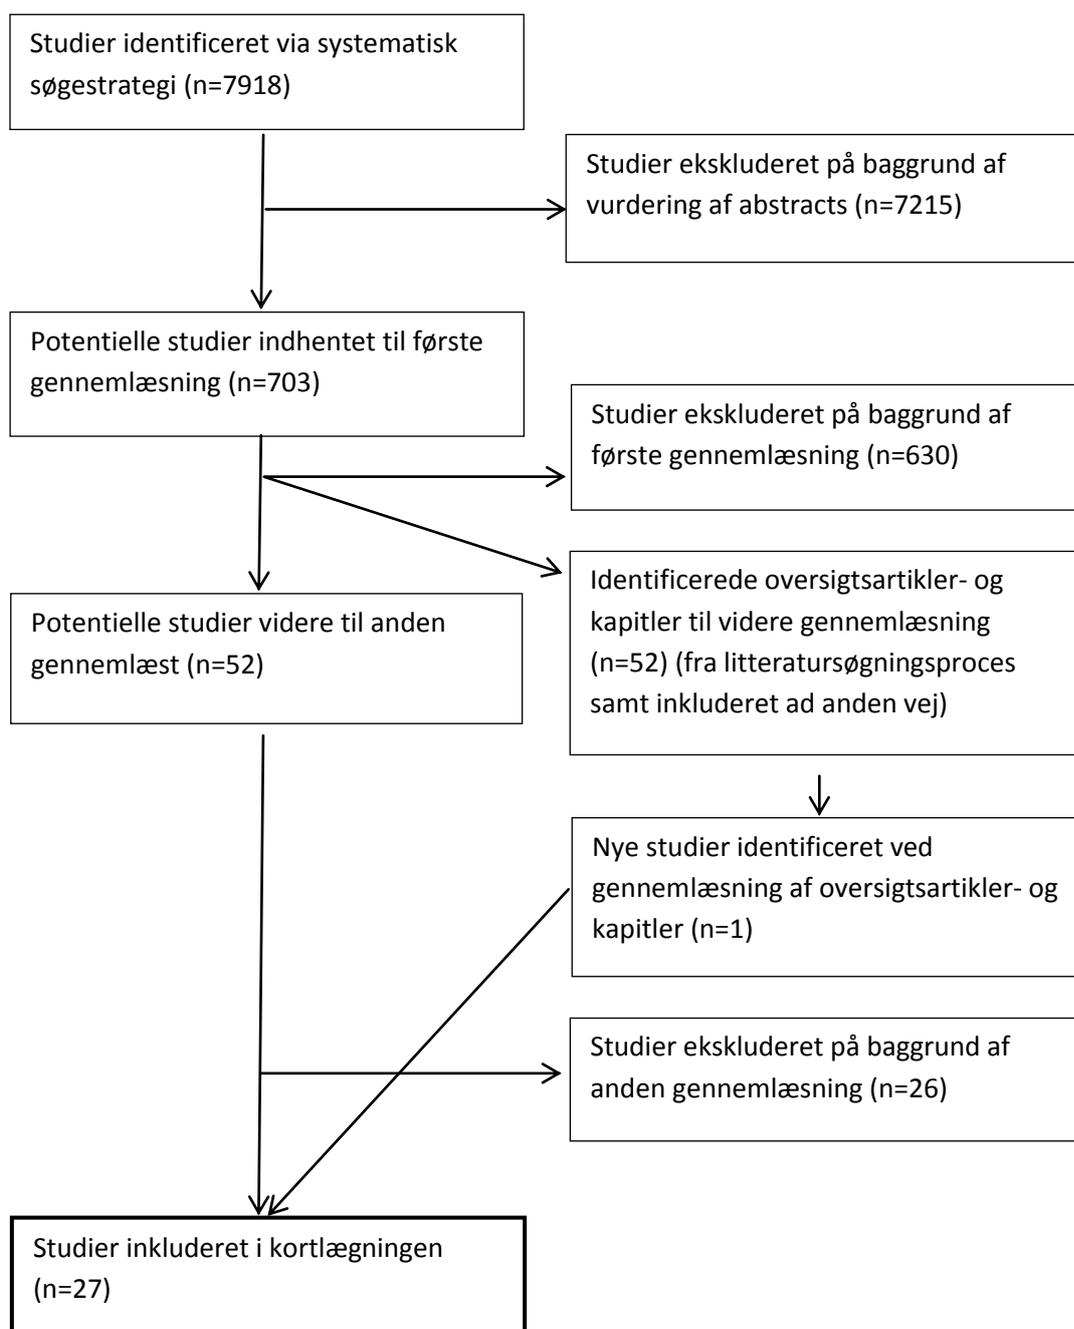

Endelig blev identificerede oversigtsartikler- og kapitler gennemgået med henblik på at opfange studier, der var faldet udenfor den systematiske litteratursøgningsproces.

I afsnit 8 er præsenteret en komplet referenceliste med udgangspunkt i første gennemlæsning. Herunder udspecificeres hhv. de studier, der er med i den endelige forskningsoversigt, samt alle

gennemgåede oversigtsartikler- og kapitler, samt en liste over ekskluderede studier med begrundelse herfor.

3.4. FLOWCHART

Nedenfor præsenteres et flowchart af screeningsprocessen, hvor venstre række beskriver forløbet fra gennemgang af abstracts (trin 1) til den endelige pulje af inkluderede studier. Højre side angiver antallet af studier, der blev ekskluderet/inkluderet ved hvert trin i forløbet.

3.5. KODNING

Studier inkluderet i den endelige kortlægning blev kodet ud fra en række karakteristika, der inkluderede deltagere, studiedesign, intervention, resultater og kvalitetsvurdering. Alle studier blev gennemgået af minimum to personer, og uoverensstemmelser blev drøftet og verificeret. Endelig blev resultaterne fra kodningen indtastet i SPSS (version 19) mhp. analyse, og videre benyttet til at udforme genbeskrivelsestabellen.

Det er vigtigt at understrege, at kortlægningen udelukkende gengiver information tilgængelig i de inkluderede publikationer. Bagvedliggende eller uddybende informationer blev ikke søgt indhentet grundet forskningsoversigtens tidsmæssige omfang. Derudover refereres udelukkende resultater, som er meningsfulde i forhold til forskningsoversigtens fokus. Dette betyder, at supplerende resultater ikke nødvendigvis er medtaget i de deskriptive analyser, genbeskrivelsestabel eller effektanalyser.

Følgende gengiver (i oversigtsform) kodningens form og indhold

REFERENCE	Bibliografisk reference, publicerings år, publikationstype
DELTAGERE	Alder, dominerende etnicitet, antal deltagere (interventions- og kontrol gruppe), køn, population, land
STUDIEDESIGN	Studietype, studiedesign, dataindsamling, followup, primære effektmål, sekundære effektmål, dataindsamler
INTERVENTION	Titel på intervention, interventionsformål, interventionsmålgruppe, interventionskontekst, facilitator, interventionsaktiviteter, interventionselementer, interventionsomfang, interventionsperiode, forandringsteori
RESULTATER	Resultater ved primære effektmål, resultater ved sekundære effektmål, studiets hovedresultater
KVALITETSVURDERING	Formål/teori, interventionens udførelse, bias/confounders, validitet/reliabilitet

4. STUDIER I FORSKNINGSOVERSIGTEN

Den endelige forskningsoversigt indeholder 27 originalstudier, der samlet beskriver 26 individuelle interventioner. Af de 27 studier var 85 % (n=23) tidsskriftsartikler og 15 % (n=4) ph.d.-afhandlinger. Følgende afsnit har til hensigt at give et overblik over interventionerne i forskningsoversigten, opdelt i hhv. deltagere, studiedesign, intervention, resultater og kvalitetsvurdering. Samme inddeling går igen i genbeskrivelsestabellen.

4.1. DESKRIPTIVE DATA

4.1.1. DELTAGERE

Antallet af deltagere på tværs af interventionerne varierede fra 59 til 2540 deltagere (median=313). Deltagernes gennemsnitsalder var 15,25 år (beregnet på baggrund af data fra 13 studier, idet de resterende ikke oplyste en gennemsnitsalder). Aldersintervallet spændte fra 10-24 år (n=15). Deltagerne i interventionerne havde varierende etnicitet, hvor 30 % af interventionerne opgav *white* som dominerende etnicitet, 15 % *black*, 5 % *latin*, og 50 % af interventionerne rapporterede blandet etnicitet. Interventionerne var primært udviklet og afprøvet i USA (n=18), men også andre kontinenter var repræsenteret. Tre interventioner var fra Afrika, 1 var fra Canada, 1 var fra Asien, 1 var fra Europa, og 1 var fra Mellemøsten. Alle studier anvendte deltagere fra normalpopulationer. Interventionerne var således ikke målrettet elever med særlige behov.

4.1.2. STUDIEDESIGN

Alle inkluderede studier anvendte kvantitative metoder, mens et enkelt også inddrog kvalitative metoder. Ved elleve af interventionerne anvendtes et randomiseret kontrolleret design, tre benyttede en sammenligningsgruppe og tolv anvendte et pre/post-test design. Elleve inkluderede, udover postinterventions data, en eller flere op følgende målinger (betegnet 'followup'). Followup målingerne varierede tidsmæssigt med en spændvidde fra 1 måned til 48 måneder (median=6 mdr.). Endelig blev data ved 11 af interventionerne indsamlet af en forsker, ved to interventioner indsamlet af underviser/praktiker, ved tre interventioner i kombination forsker/praktiker, mens der ved fire interventioner benyttedes en anden form for dataindsamling (fx computer).

4.1.3 INTERVENTION

23 af interventionerne var rettet imod både drenge og piger, hvor tre interventioner udelukkende adresserede henholdsvis piger (n=2) og drenge (n=1). I alle tilfælde foregik interventionen på en skole (i et enkelt studie var dette uoplyst). Interventionen blev i de fleste tilfælde faciliteret af lærere (n=6) eller eksterne konsulenter (n=14). Yderligere blev nogle af interventionerne faciliteret af jævnaldrende/ældre studerende (n=3), samt af forsker (n=4).

Interventionsaktiviteter var primært klasseundervisning (n=23) og diskussion (n=21). Yderligere anvendtes multimedie (n=14) og adfærdstræning/rollespil (n=12).

Interventionernes indhold (interventionselementer) varierede betragteligt, og langt de fleste interventioner inkluderede multiple elementer. Elementerne fordelte sig således: information/viden (n=24), normer/holdninger (n=23), identificering af vold (n=17), socialisering (n=15), risikoadfærd (n= 4), forebyggelsesfærdigheder (n=11), kønsroller/kønsdiskriminering (n=9), ansvar (n= 9), kommunikation (n= 8), konflikthåndtering (n=4), og empati (n=1).

Interventionernes tidsmæssige omfang varierede i betydelig grad. Således var længden på interventionerne (n=15) imellem 45 minutter og 12,5 timer (median=4 timer). Ved knap halvdelen af interventionerne (n=11) oplystes ikke interventionstid i timer eller minutter. Interventionsperioden varierede ligeledes betragteligt, fra 1 til 120 dage (median=31,5 dage; n=16).

Elleve af interventionerne var udviklet på baggrund af en forandringsteori eller forandringsmodel, hvilket må anses som en styrke. Eksempler på teorigrundlag var *Social Norms Theory*, *Social Learning Theory* mv. (se genbeskrivelsestabel).

4.1.4. RESULTATER

Der indgik kun primære effektmål i en mindre del af interventionerne (n=5). Derimod havde langt størstedelen af undersøgelserne inkluderet sekundære effektmål (n=25), herunder effektmål omhandlende holdninger/normer (n=20), viden (n=14), adfærd/adfærdsintentioner (n=6), konflikthåndtering (n=2), empati (n=1), kommunikation (n=1) og blandet (n=4).

Interventionernes effekt er opgjort som effektstørrelser. Disse præsenteres i genbeskrivelsestabellen og behandles i analyseafsnittet

4.1.5. KVALITETSVURDERING

I den samlede vurdering af interventionernes forskningsmæssige kvalitet havde 23 % (n=6) lav kvalitet, 27 % (n=7) lav/medium kvalitet, 27 % (n=7) medium kvalitet, og 23 % (n=6) medium/høj kvalitet.

Modsat de mere faktuelle oplysninger i nærværende deskriptive afsnit er kvalitetsvurderingen baseret på koderens vurdering af studiets forskningsmæssige kvalitet. Altså, i hvilken grad resultater er fremkommen på baggrund af en given intervention versus som følge af tilfældigheder eller ikke-relaterede faktorer. Herunder vurderes bl.a. stringens i interventionslevering, udvælgelse af deltagere til studiet, håndtering af forstyrrende faktorer (confounders), kvalitet af måleinstrumenter, antal deltagere og endelig resultaternes overordnede pålidelighed.

4.2. GENBESKRIVELSE

Genbeskrivelsestabellen har til formål at give et overblik på interventionsniveau, og er struktureret med udgangspunkt i deltagere, design, effektmål, intervention, resultater og kvalitetsvurdering. Det fremgår endvidere af tabellen hvilke studier, der dækker over hvilke interventioner.

Det skal understreges, at forskningsoversigten udelukkende bygger på tilgængelige originalstudier, hvorfor der bør tages højde for en vis selektionseffekt. Der er således ikke inkluderet upubliceret arbejde, der erfaringsmæssigt har karakter af nul- eller negative fund (*file drawer problem*).

Udover information, baseret på kodningsarkene, præsenteres ligeledes effektstørrelser for henholdsvis primære- og sekundære effektmål. Med henblik på effektvurdering og sammenligning af inkluderede studier er interventionseffekten i genbeskrivelsestabellen opgjort i effektstørrelse (*ES*) i form af Cohen's *d*, idet der skelnes imellem en lille, moderat og stor effekt.

I studier, der inddrager interventions- og kontrolgruppe, er effektstørrelserne udregnet ved brug af henholdsvis post intervention og followup data, mens pre- og postinterventionsdata er benyttet i studier uden kontrolgruppe. Så vidt muligt er der anvendt deskriptive data fra relevante effektmål (typisk gennemsnitsscore, standard afvigelse og populationsstørrelse). Såfremt deskriptive data ikke fremgik af de inddragede studier, er interventionernes effekt så vidt muligt estimeret på baggrund af resultater fra statistiske tests (typisk variansanalyse/regressionsanalyse).

Oversigt over effektstørrelser:

Effektstørrelse (<i>ES</i>)	<i>d</i>	% varians
lille	.2	1
moderat	.5	6
stor	.8	16

Genbeskrivelsestabellen er præsenteret i følgende afsnit.

5. ANALYSE

Nærværende analyseafsnit er baseret på informationer præsenteret i genbeskrivelsestabellen, som inkluderer 26 interventioner baseret på 27 originalstudier. Analyserne er foretaget på interventionsniveau, hvor op til flere studier kan omhandle samme intervention.

I følgende analyseafsnit opsummeres interventionseffekt i henhold til primære- og sekundære effektmål. Herunder beskrives kort de interventioner, som har vist moderat til stor effekt. Derudover vurderes om studier, der dokumenterer moderat til stor effekt, adskiller sig væsentligt på udvalgte interventionskarakteristika (kontekst, målgruppe, aktiviteter, elementer, omfang og forandringsteori) samt forskningsmæssig kvalitet. Det skal her pointeres, at beskrivelse af interventionskarakteristika er sparsom grundet forskningslitteraturens format. En mere uddybende gengivelse vil kræve indsigt i den bagvedliggende programmanual og/eller andre materialer.

Primære effektmål refererer til mål på udøvelse af og/eller udsættelse for seksuelt overgreb samt øvrige typer af interpersonel vold. For at en intervention kan siges at have en positiv effekt i henhold til primære udfald, skal studiet være i stand til at dokumentere en reducere i udøvelse af og/eller udsættelse for overgreb fra jævnaldrende, i sammenligning med en kontrolgruppe.

Sekundære effektmål inkluderer mål på variable, der formodes at have en positiv effekt på reducere af seksuelle overgreb. Det vil med andre ord sige interventionskomponenter, der alene eller i kombination antages at være forandringsskabende i forhold til forekomst. Som anført i genbeskrivelsestabellen benyttes en række forskellige sekundære effektmål i de inkluderede og vurderede studier, herunder måleredskaber der belyser viden, holdninger/normer, og adfærd/adfærdsintentioner, mv. For at en intervention kan siges at have en positiv effekt i henhold til sekundært effektmål, skal studiet være i stand til at dokumentere en ændring i minimum et af ovenstående mål. Enten ved sammenligning med kontrolgruppe eller ved brug af pre/post-test måling.

5.1. PRIMÆRE EFFEKTMÅL

Fem ud af de i alt 26 inkluderede interventioner rapporterer primære effektmål. Herunder identificeres en lille til stor effekt ved interventionen udviklet af Martin et al. (2012), ingen til moderat effekt ved interventionen "Interaction" (Taylor et al., 2010a), samt ingen til lille effekt ved interventionen "Law and Justice" (Taylor et al., 2010b). Blandt de to resterende interventioner "Safe Dates" (Foshee et al., 2000, Foshee et al., 2004, Foshee et al., 2005) samt "Ending Violence" (Jaycox et al., 2006) ses ingen effekt.

I det følgende præsenteres i oversigtsform interventionskarakteristika ved de to interventioner, hvor der ses en moderat til stor positiv effekt ved primære effektmål:

1. *Interventionen udviklet af Martin et al. (2012)* fandt sted i en skolekontekst og adresserede begge køn. Interventionsaktiviteterne var hovedsageligt gruppebaseret undervisning og/eller diskussion samt brug af videomateriale. Elementerne i programmet omhandlede viden og information omkring bl.a. seksuel tvang, holdninger til overgreb, forskellige typer risikoadfærd (fx brugen af alkohol), empati med ofret samt kommunikation omkring seksuelle forhold. Interventionen strakte sig over i alt syv timer. Der blev ikke identificeret en forandringsteori.
2. *"Interaction"* (Taylor et al., 2010a) fandt sted i en skolekontekst og adresserede begge køn. Interventionsaktiviteterne var gruppebaseret undervisning og diskussion, der lagde op til udfordring af målgruppens holdninger og normer. Elementerne i programmet omhandlede bl.a. grænsesætning i forhold, udvikling af og intimitet i forhold, ønsket versus uønsket adfærd, samt tilskueradfærd. Interventionen strakte sig over 5 lektioner (af 40 min.) og tog udgangspunkt i forandringsteorien "Theory of reasoned action".

I interventionen udviklet af Martin et al. (2012) beskrives udelukkende en positiv effekt i henhold til udøvelse af seksuelt overgreb. Vurderes resultaterne fra "Interaction" på variabelniveau (se genbeskrivelsestabel) bliver det tydeligt, at der er variation i effektstørrelserne. Både på tværs af de enkelte effektvariable (hhv. udøvelse af- og udsættelse for seksuelt overgreb) samt på tværs af målingstidspunkterne (fra post-interventions måling til follow-up måling). Det er således ikke muligt at konkludere entydigt på effekten af interventionen "Interaction".

Sammenlignes interventionskarakteristika på tværs af interventioner med hhv. moderat til høj positiv effekt, ingen til lille effekt samt ingen dokumenteret effekt fremkommer ingen væsentlig forskelle. Det er således ikke muligt at fremhæve interventionskarakteristika, der i særlig grad beskriver interventioner, der har lykkedes med at reducere forekomsten af overgreb.

Selvom kvalitetsvurderingen på tværs af de fem interventioner vurderes til at være medium til medium/høj er det værd at bemærke, at der er en vis usikkerhed forbundet med de måleredskaber, der er benyttet. Hovedparten af måleredskaberne er enten udviklet til studiet eller revideret til formålet. Endelig er resultaterne fra interventionen "Safe Dates" (Foshee et al.; 2000, 2004, 2005) opgjort på en sådan måde, at beregningen af effektstørrelser er usikker, hvorfor disse bør tolkes med forsigtighed.

5.2. SEKUNDÆRE EFFEKTMÅL

Ved 25 ud af 26 interventioner er der rapporteret sekundære effektmål. Den enkelte intervention kan være vurderet på baggrund af flere mål. Samlet set indikerer studierne, at seks interventioner viser en lille til stor effekt, at 16 interventioner viser ingen til moderat effekt, samt at tre interventioner ingen effekt har. Overordnet har langt hovedparten af interventionerne været i stand til at ændre de potentielt forandringskabende komponenter, omend størstedelen dokumenterer en lille effekt.

Hovedparten af de sekundære effektmål omhandler viden (14 ud af 25), holdninger/normer (20 ud af 25), og adfærd/adfærdsintentioner (6 ud af 25). Følgende afsnit vil gennemgå de sekundære effektmål enkeltvist.

5.2.1. VIDEN

I fire ud af 14 interventioner, der benytter viden som sekundært effektmål, ses en moderat til stor effekt, ved 8 af interventionerne rapporteres et spektrum fra ingen til moderat effekt, og ved de sidste to interventioner ses ingen effekt. Hovedparten af interventionerne er altså overordnet set lykkedes med at gøre målgruppen mere vidende.

Viden er operationaliseret meget forskelligartet på tværs af interventionerne, og dækker bl.a. over faktisk viden omkring forekomst og definition af overgreb, typiske overgrebskarakteristika, konsekvenser af overgreb, samt hjælpemuligheder i tilfælde af overgreb. Det antages af øget vidensniveau fører til reducere af overgreb.

I det følgende præsenteres i oversigtsform interventionskarakteristika ved de fire interventioner, hvor der ses en moderat til stor positiv effekt ved viden som sekundært effektmål:

1. *"The Safe Relationships Program"* (SRP; Lowe & Banks, 2007) fandt sted i en skolebaseret kontekst og adresserede begge køn. Interventionsaktiviteterne var gruppebaseret undervisning og diskussion samt brug af filmmateriale. Elementerne i programmet omhandlede definition af hhv. seksuelle overgreb, tvang, overgrebsforebyggelse, og egne grænser, samt information omkring ofrets rettigheder, seksuelt samtykke, og sunde forhold mv. Interventionen strakte sig over fire timer, og der blev ikke identificeret en forandringsteori.
2. *"Sexual Abuse Prevention Education Package"* (SAPEP; Ogunfowokan & Fajemilehin, 2012) fandt sted i en skolekontekst og adresserede udelukkende piger. Interventionsaktiviteterne var klasseundervisning og diskussion. Elementerne i interventionen omhandlede bl.a. information omkring definition af forskellige typer overgreb og overgrebskarakteristika, holdninger til overgreb, samt præsentation af forebyggelsesfærdigheder. Interventionen strakte sig over fem timer, og var baseret på The Neuman Health Care Systems Model.

3. *"The Community Awareness Rape Education Program"* (CARE; Wright et al., 2000) fandt sted i en skolekontekst og adresserede begge køn. Interventionsaktiviteterne var undervisning, diskussion og rollespil. Elementerne i interventionen var information omkring hhv. overgrebsstatistik og myter (holdninger) til seksuelle overgreb. Interventionens omfang er uklar, og der blev ikke identificeret en forandringsteori.
4. *"Educational Program for the Prevention of Sexual Violence"* (EPSV; Yom & Eun, 2005) fandt sted i en skolekontekst og adresserede udelukkende drenge. Interventionsaktiviteten var en CD-rom indeholdende fire overordnede temaer. Temaerne (interventionselementerne) var hhv. information omkring overgreb, case materiale, forebyggelse og endelig generel information omkring sex. Interventionens omfang var uklar, og der blev ikke identificeret en forandringsteori.

Til sammenligning med de øvrige interventioner, der rapporterer om viden som sekundært effektmål, adskiller de fire interventioner sig ikke væsentligt med henvisning til interventionskarakteristika. Det er således ikke muligt at fremhæve interventionskarakteristika, der i særlig grad beskriver interventioner, der har lykkedes med at ændre målgruppens vidensniveau.

De fire interventioner, med moderat til stor effekt, vurderes imidlertid at have en lav til medium kvalitet. Kvaliteten er endvidere markant lavere end blandt de øvrige ti interventioner der rapporterer på viden. Dette kunne indikere, at interventionernes effekt delvis afspejler forskningsmetodiske begrænsninger (herunder begrænset deltagerantal), hvorfor resultaterne bør tolkes med en vis forsigtighed.

Derudover er kun en ud af fire interventioner (SAPEP) vurderet med henblik på effekt over tid, hvor interventionen fortsat viser sig at have en moderat effekt ved followup målingen godt et halvt år senere. Ved dette studie kunne det imidlertid tyde på, at den viden, målgruppen har tilegnet sig ved interventionen, forbliver over tid.

5.2.2. HOLDNINGER/NORMER

Der ses en lille til stor effekt ved fire ud af de 20 interventioner, der er vurderet med henblik på holdningsændring. Ved 12 af interventionerne ses ingen til moderat effekt, og ved de sidste fire ses ingen effekt. Interventionerne er altså overordnet lykkedes med at ændre målgruppens holdninger, om end kun en femtedel af interventionerne viser moderat til stor effekt.

Holdninger/normer er igen operationaliseret meget forskelligartet på tværs af interventionerne, og dækker bl.a. over positive holdninger til forskellige typer overgreb (fx at det er tilladt at voldtage en pige, hvis hun har været fuld eller udfordrende klædt) samt voldsaccepterende/kønsstereotype normer (fx at en mand har ret til at tvinge sin hustru til sex ved brug af fysisk vold). Det antages at ændring af holdninger/normer fører til reduceret forekomst.

I det følgende præsenteres i oversigtsform interventionskarakteristika ved de fire interventioner, som har rapporteret en moderat til stor effekt ved holdninger/normer som sekundært effektmål:

1. *"The Dating Violence Prevention Project Curriculum"* (DVPC; Black et al., 2012) fandt sted i en skolekontekst og adresserede begge køn. Interventionsaktiviteterne var undervisning, gruppediskussioner og rollespil/adfærdstræning. Elementerne i interventionen omhandlede forskellige typer aggression og kontrol i forhold, kommunikationsevner og håndtering af vrede, rettigheder og ansvar i forhold, identificering af uacceptabel adfærd, samt information omkring hjælpemuligheder i tilfælde af overgreb. Interventionen strakte sig over otte timer, og der blev ikke identificeret en forandringsteori
2. *"The Peer Education Project"* (PEP; Smith & Welchans, 2000) fandt sted i en skolekontekst og adresserede begge køn. Interventionsaktiviteten var undervisning i hhv. klasselokale og større forsamling (der inkluderede lærere, forældre samt elever). Elementerne i interventionen omhandlede information omkring seksuelle overgreb, viden om hjælp til ofre for overgreb, samt ansvar i forhold til forebyggelse. Interventionen strakte sig over i alt 45 minutters klasseundervisning samt oplæg i større forsamling. Der blev ikke identificeret en forandringsteori.
3. *Interventionen udviklet af Smothers & Smothers (2011)* fandt sted i en skolekontekst og adresserede begge køn. Interventionsaktiviteterne var undervisning, diskussion og adfærdstræning. Elementerne i interventionen omhandlede definitioner af sunde forhold, kontrol og rettigheder over egen krop, samt hjælpemuligheder i tilfælde af overgreb. Interventionen havde et omfang af tre timer og der blev ikke identificeret en forandringsteori.
4. *"Educational Program for the Prevention of Sexual Violence"* (EPSV; Yom & Eun, 2005) fandt sted i en skolekontekst og adresserede udelukkende drenge. Interventionsaktiviteten var en CD-rom indeholdende fire overordnede temaer. Temaerne (interventions elementerne) var hhv. information omkring overgreb, case materiale, forebyggelse og endelig generel information omkring sex. Interventionens omfang var uklart, og der blev ikke identificeret en forandringsteori.

Sammenholdt med de interventioner, som rapporterer lavere effekt på holdnings-/normændring, adskiller de fire interventioner sig ikke væsentligt i henhold til interventionskarakteristika. Det samme billede tegner sig for kvalitetsvurderingen.

Det bør imidlertid pointeres, at kvaliteten blandt de fire interventioner er vurderet til et sted imellem lav og medium. Måleredskaberne er enten udviklet til eller tilpasset til studiet, og der er således ikke benyttet velafprøvet instrumentarium, hvilket skaber usikkerhed omkring studierne validitet og reliabilitet. Yderligere rapporteres udelukkende effektmål ved postintervention, hvorfor der er usikkert, om den positive ændring forbliver over tid.

5.2.3. ADFÆRD/ADFÆRDSINTENTIONER

Der rapporteres effektmål omkring adfærd/adfærdsintention i seks ud af totalt 26 interventioner. Heraf viser en enkelt intervention lille til moderat effekt, to interventioner ingen til lille effekt og tre interventioner ingen effekt.

Adfærd/adfærdsintentioner dækker over en række forskellige operationaliseringer, der blandt andet omhandler risikoadfærd (indtag af alkohol eller seksuel risikoadfærd) samt intentioner omkring overgrebsadfærd under særlige omstændigheder (fx ønske om at udsætte en person for overgreb hvis det garanteres, at det ikke får efterfølgende konsekvenser).

Idet der ikke rapporteres om moderat til stor effekt, gennemgås interventionerne ikke yderligere. Det bør imidlertid fremhæves, at de seks interventioner, der har rapporteret sekundære effektmål omkring adfærd/adfærdsintentioner ikke adskiller sig væsentligt fra hinanden med henvisning til interventionskarakteristika og kvalitetsvurdering.

5.3. SAMMENFATNING

Opsummerende inddrages primære effektmål i en meget begrænset andel af de inkluderede studier i forskningsoversigten. Heraf ses moderat til stor positiv effekt ved knap halvdelen af interventionerne. Dette er naturligvis problematisk, idet langt hovedparten af studierne har haft til overordnet formål at reducere forekomsten af seksuelle overgreb. Samtidig betyder det, at vores viden om interventionernes faktiske effekt er sparsom.

Selvom der udefra Cohens konventioner ikke ses store effekter på de primære effektmål, er det dog centralt at notere sig, at selv en lille effektstørrelse kan være væsentlig i denne sammenhæng. Som eksempel kan en lille effektstørrelse på $d = .20$ (varians på 1 %) potentielt betyde en forskel på 10 ofre for overgreb imellem interventions- og kontrolgruppen i et studie med 2000 deltagere.

I langt hovedparten af interventionerne rapporteres sekundære effektmål, herunder viden, holdninger/normer og adfærd/adfærdsintentioner. Hvor 12 ud af 14 interventioner rapporterer om positiv effekt på vidensniveau, indikerer 16 ud af 20, at der er sket en positiv ændring af deltagernes holdninger/normer. Samlet set har størstedelen af interventionerne i forskningsoversigten formået at ændre målgruppens viden hhv. holdninger, omend der hovedsageligt ses en mindre effekt.

En ændring i de sekundære effektmål er imidlertid ikke i sig selv en garanti for reducere af forekomst, men snarere et udtryk for, at en given intervention har lykkedes med at ændre de forhold, der formodes at have en indflydelse på udøvelse og/eller udsættelse for seksuelt overgreb fra jævnaldrende.

Selvom der eksisterer en lang række velvaliderede måleredskaber til vurdering af hhv. forekomst af overgreb, overgrebsrelateret viden- og holdninger (Koss, White & Kazdin, 2011), er langt

hovedparten af de benyttede måleredskaber i nærværende forskningsoversigt enten udviklet til eller tilpasset det enkelte studie. Dette kan meget vel være et resultat af, at måleredskaberne oprindeligt er udviklet til en ældre population, hvorfor det har været nødvendigt at alderstilpasse målene. En anden begrundelse kan være, at måleredskaberne er udviklet specifikt til at belyse de variable, en given intervention ønsker at ændre. Herved opstår imidlertid en række udfordringer i forhold til konklusionernes gyldighed, idet det eksempelvis skaber usikkerhed omkring hvad måleredskaberne belyser. Ligeledes vanskeliggør det dels at replicere resultaterne, dels at sammenligne interventionernes effekt på tværs af studierne.

Der har endvidere vist sig at være stor variation imellem studierne kvalitet, hvilket afspejler et interventions- og forskningsfelt som er meget uensartet. Dog ligger alle studierne, som rapporterer primære effektstørrelser, i den øverste ende i henhold til forskningskvalitet. Resultaterne herfra formodes således at være relativt valide.

I forskningsoversigten er der identificeret 26 individuelle interventioner til forebyggelse af seksuelle overgreb blandt unge, hvoraf størstedelen er skolebaserede forebyggelsesprogrammer. Forebyggelse i regi af skolekontekst er intuitivt meningsfuldt, idet det giver mulighed for at nå ud til en stor population, i nogle tilfælde en hel årgang, af både drenge og piger. Endvidere kan interventionen målrettes klassesettrin og i nogle tilfælde stå i stedet for eller supplere den obligatoriske undervisning i eksempelvis seksualitet eller relations-/familiekundskab.

Derudover er langt hovedparten udviklet til adressering af begge køn på én gang (23 ud af 26 interventioner) hvilket er en interessant betragtning, idet meget af den øvrige forebyggelseslitteratur til forebyggelse af seksuel vold historisk set ofte har været opdelt på baggrund af køn (Gydcz et al., 2011).

Afslutningsvist skal det nævnes, at det ikke har været muligt at identificere bestemte interventionskarakteristika (målgruppe, aktiviteter, elementer og omfang) som særligt fremherskende blandt interventioner med størst effekt ved hhv. primære- og sekundære effektmål.

6. ANBEFALINGER

I følgende afsnit præsenteres en række anbefalinger til kvalificering af det videre arbejde med at udvikle og/eller versionere forebyggelsestiltag til en dansk ungekontekst. Anbefalingerne er baseret på materiale præsenteret i nærværende forskningsoversigt:

1. Ved udvikling og/eller versionering af ny forebyggelsesindsats tages ideelt set udgangspunkt i en intervention, som har udvist entydig effekt på primære effektmål (hvh. udøvelse af samt udsættelse for seksuelle overgreb) i anden kontekst. Som påvist i forskningsoversigten, eksisterer der kun et meget begrænset antal interventioner, hvis primære effekt er belyst i litterature. Studierne er endvidere forbundet med en række metodiske udfordringer, hvorfor det er sparsomt med viden omkring effektiv forebyggelse, der viser dokumenteret reducere i forekomst. Det er således ikke muligt at pege på enkeltstående interventioner, som med fordel kan afprøves i en dansk ungekontekst. I stedet fremhæves interventioner med moderat til høj effekt.
 - Det anbefales at indhente programmanualer og/eller øvrige materialer fra interventionerne med moderat til høj effekt ved primære effektmål. Herfra kan der med fordel udvælges en række elementer, som versioneres og afprøves i en dansk kontekst.
2. Overordnet eksisterer en række gode erfaringer fra interventioner, der benytter sekundære effektmål. Samtidig må det understreges, at effekt er fremkommen ved afprøvning af given intervention i særlig kontekst/målgruppe/dosering, som alle er forhold, der ikke nødvendigvis gør sig gældende i en dansk ungesammenhæng.
 - Det anbefales at indhente programmanualer og/eller øvrige materialer fra interventionerne med moderat til høj effekt ved sekundære effektmål. Herfra kan der med fordel udvælges en række elementer, som versioneres og afprøves i en dansk kontekst.
3. Der har i litteraturen været en bagvedliggende antagelse om, at positiv ændring af de formodet virksomme komponenter (særligt viden og holdninger/normer) automatisk resulterer i reducere af forekomst. Men sådanne antagelser er blevet udfordret i forskningslitteraturen, som bl.a. understreger, at ændringer i én til to formodet virksomme variable ikke nødvendigvis er tilstrækkelig til reducere af forekomst (Koss, White & Kazdin, 2011). Herunder fremhæves det, at en identificering af de bagvedliggende årsager til overgreb må være bestemmende for, hvilke komponenter der inkluderes i en given intervention (WHO, 2010; Dahlberg & Mercy, 2009). Ifølge WHO (Dahlberg & Krug, 2002) udspringer overgreb imidlertid af komplekst samspil imellem årsager på flere niveauer, fra

individuel- til samfundsmæssigt plan (Den Socialøkologiske Model, Bronfenbrenner, 1979). Som eksempler kan nævnes tidligere overgreb i barndommen, brugen af alkohol og stoffer, seksuel risikoadfærd, mangelfuld grænsesætning og risikovurdering, uklar kommunikation og signaler, pres fra kammerater, normer i kammeratskabsgruppen, opvækst i ressourcervag familie, lav forældreinvolvering, kontekstuelle faktorer som fester og isolerede steder, samt samfundsmæssig accept af overgreb mv. (Bramsen, 2012). Videre anføres det, at interventioner til forebyggelse ideelt set adresserer flere årsager på én gang, for at øge sandsynligheden for reducere af forekomst.

- Det anbefales at interventioner til forebyggelse inkluderer en række formodede virksomme komponenter, baseret i viden omkring årsagerne til overgreb.
4. Som beskrevet, er det centralt at effektvurderingen af en given intervention finder sted med udgangspunkt i validt instrumentarium, hvor det sikres, at måleredskaber har tilfredsstillende psykometriske egenskaber. Ellers er det vanskeligt at vurdere, om en given intervention virker efter hensigten, eller må justeres fremadrettet. Aktuelt er langt hovedparten af områdets måleredskaber udviklet til og afprøvet i en voksenpopulation. Endvidere findes kun et meget begrænset udvalg af mål på dansk, hvorfor der må foregå dels en sproglig oversættelse, og dels en versionering til og validering i en dansk ungekontekst.
- Interventioner skal effektevalueres med passende måleredskaber, der er målrettet alder, kultur og kontekst. Herunder inkluderes hhv. primære og sekundære effektmål på en række forskellige parametre
5. Hvorvidt en intervention er i stand til at implementeres succesfuldt afhænger af dens gennemførlighed, hvorvidt den er anvendelig samt om den accepteres af målgruppen. Fordi langt hovedparten af interventionerne er gennemført i USA er det vanskeligt at vurdere, i hvilken grad og med hvilken succes interventionselementer kan implementeres i en dansk ungekontekst. Det er derfor vigtigt at inkludere praksisaktører i udformningen af forebyggelsesprogrammer, således at interventionen kan målrettes ungegruppens behov, sprogbrug, kultur mv. Udover de aktører, som er nævnt i nylig dansk rapport (Bramsen, 2012), henvises også til projekt "Fra viden til forebyggelse" ved Rigshospitalets Center for Seksuelle Overgreb (2012).
- Benyt viden og erfaringer fra relevante praksisaktører i udvikling og implementering af forebyggelsesprogrammer

6. Endelig må det fremhæves, at langt hovedparten af forskningslitteraturen omkring primær forebyggelse af seksuelle overgreb er fremkommen i en ældre aldersgruppe (primært college studerende) (Gidycz et al., 2011).
- Det anbefales at orientere sig blandt de interventioner, der har vist god effekt ved primær forebyggelse af seksuel vold blandt en ældre aldersgruppe
7. Afslutningsvist henvises til de mere generelle anbefalinger, som er præsenteret i Bramsen (2012; 46), hvor effektiv primær forebyggelse:

- Er baseret på folkesundhedstilgangen og følger tilgangens fire trin konsekutivt:
 - Trin 1: Problembeskrivelse
 - Trin 2: Identificering af årsager
 - Trin 3: Forebyggelse
 - Trin 4: Implementering og udbredelse
- Har politisk opbakning, fornødne økonomiske ressourcer, samt en tilstrækkelig tidsramme at operere inden for.
- Er funderet i evidensbaseret viden og bidrager til at opbygge et solidt vidensfundament ved dokumentation og udbredelse af konkrete erfaringer.
- Inkluderer et systematisk og stringent evalueringsdesign.
- Udspringer af samarbejde imellem forskere, praktikere og beslutningstagere.
- Inddrager samarbejde imellem praksisaktører på tværs af niveauer i den Socialøkologiske model og opdyrker partnerskab med relaterede felter.
- Er baseret på testbare teoretiske rationaler.
- Er specifikt målrettet modtagerens behov, alder, køn, udviklingstrin og kultur mv.
- Fremmer udviklingen af sunde forhold – reducerer ikke blot risikofaktorer.
- Inkluderer begge køn og ideelt alle alderstrin.
- Udfordrer fremherskende kulturelle normer.
- Er omfattende og inkluderer multiple:
 - niveauer af den Socialøkologiske model
 - interventionsformer og metoder
 - sammenhænge og kontekster
- Har en tilstrækkelig dosering således at modtagerne eksponeres i en sådan grad, at aktiviteten har en effekt.

8. STUDIER I FORSKNINGSOVERSIGTEN

Nedenfor præsenteres en komplet referenceliste med udgangspunkt i første gennemlæsning. Herunder udspecificeres hhv. de studier, der er med i den endelige forskningsoversigt (kolonne **A**), samtlige gennemgåede oversigtsartikler og/eller kapitler (kolonne **B**), samt en liste over ekskluderede studier med begrundelse herfor (eksklusionskriterier) (kolonne **C**).

Eksklusionskriterierne (kolonne **C**) er som følger:

1. = publicerings år
2. = udgivelse (sprog)
3. = udgivelse (tidsskrift, bog, rapport eller afhandling)
4. = deltagernes alder
5. = primære fokus på forebyggelse
6. = rapporteret effekt af intervention
